

ABSTRACT

A method of operating a printing device for rendering data encoded in a raster form includes receiving by short range wireless communication an intermediate data which includes image data corresponding to at least part of the content and extracting the image data from the intermediate data. The image data is converted to data in a page description language form, and the data in the page description language is converted to the raster form rendered by a printer engine. The data in the raster form is supplied to the printer engine.
